A METHOD FOR TREATING ALLERGIES USING SUBSTITUTED PYRAZOLES

Field of the Invention

5

This invention relates to a method for treating an allergic condition using substituted pyrazoles.

Background of the Invention

10 Atopic allergies afflict at least 20% of populations in developed countries and comprise a wide range of IgE-mediated diseases such as hay fever, asthma, atopic dermatitis, and food allergies. Exposure of an allergic subject to relevant allergens cross-links allergen specific IgE bound to mast cells, triggering degranulation and release of proinflammatory mediators, such as
15 histamine and eicosanoids, which cause the weal-and-flare response on a skin test. Characteristically, this early response is followed by a prolonged late reaction in which inflammatory cells, particularly eosinophils and activated TH-2 CD4 T cells, are recruited to the site of allergen exposure. Inflammatory cytokines such as IL-4 and IL-5, both produced by TH-2 cells, are important for
20 IgE production by B cells and for eosinophilia, respectively. Immunotherapies targeting CD4 T cells have been shown to be effective in reducing the production of IgE, the activation of proinflammatory cells, and the release of inflammatory mediators.

25 Current allergy therapies targeting CD4 T cells have met with mixed success. Desensitization with allergen extracts or vaccines is effective for many allergens, such as the *Hymenoptera* insect sting which can induce life-threatening allergic reactions. The mechanism may be either induction of T cell tolerance or the conversion of TH-2 to TH-1. However, such treatment
30 requires a long-term treatment regime, frequent doctor visits and prior stabilization by other medications, and is associated with a certain morbidity

rate and rare deaths. Alternatively, immunosuppressive drugs such as steroids which effectively stabilize ongoing allergy responses, are often associated with severe side effects.

5 The activation of CD4 T cells is a major factor in the initiation and maintenance of the allergic response. Allergens are taken up by specialized antigen presenting cells (APCs) such as dendritic cells and B cells. Protein allergens pass through the endosomal or lysosomal system where they are degraded by different proteases. These peptide fragments are bound by the
10 MHC class II molecules which, at the cell surface, are heterotrimeric complexes consisting of two transmembrane glycoprotein chains (α and β) that form a binding scaffold for the third component, a peptide of 11-20 amino acids. The antigen-MHC class II molecule complex is recognized by CD4 T cells and leads to the activation of the T cell. Activated T cells in turn activate several other
15 components of the immune system, such as B cells and macrophages, that are crucial for the body's response to pathogens, but also lead to the symptoms of allergies.

Class II molecules, like other transmembrane proteins, are translocated
20 into the endoplasmic reticulum (ER) after synthesis, where they associate with a third protein, the invariant chain (Ii). The invariant chain molecule is a type II transmembrane protein that serves as a class II-specific chaperone, promoting the exit of class II-Ii complexes from the ER and preventing class II molecules from binding to peptides and unfolded proteins in the ER and in the secretory
25 pathway. A targeting motif in the cytoplasmic tail of Ii directs the class II-Ii complexes from the secretory pathway into the endosomal system.

Before the MHC class II molecules can present antigen the Ii must be removed by a series of proteases that break down Ii. The resultant Ii peptide
30 fragments, called class II-associated invariant chain peptides (CLIP), occupy the peptide binding groove of the class II molecule, and in most cases are not spontaneously released. The CLIP protects the class II binding pocket from collapsing both during intracellular transport and after Ii degradation in the

endosomal system. Binding of antigenic peptides generated from endocytosed proteins requires an empty, and yet open binding site. The CLIP therefore must be released while the open binding site is stabilized to allow the binding of other peptides. Human Leukocyte Antigen - DM ('HLA-DM') mediates both of these functions, thus promoting the binding of antigenic peptides. After acquiring peptides, the class II molecules are transported to the cell surface via routes that are largely unknown.

In view of the above, inhibition of invariant chain proteolysis will prevent removal of Ii from the class II binding pocket, which in turn will specifically block antigen binding to the MHC class II molecule.

Cathepsin S ('CatS') is a cysteine protease expressed in lymphatic tissues. CatS mediates invariant chain proteolysis, which is a prerequisite for peptide loading of MHC class II molecules (Riese et al. (1996) *Immunity* 4:357). CatS has 50-60% homology with cathepsins L and K, but differs from them in that it has a broad pH optimum that extends to alkaline pH. CatS modulates antigen presentation in animal models, and inhibitors are effective in an asthma model (Riese et al. (1998) *J. Clin. Invest.* 101:2351). Mice deficient in cathepsin S have an impaired ability to present exogenous proteins by professional antigen presenting cells (Nakagawa et al. (1999) *Immunity* 10:207; Shi et al. (1999) *Immunity* 10:197).

Compounds that inhibit the proteolytic activity of human cathepsin S are expected to find utility in the treatment of chronic autoimmune diseases including, but not limited to, lupus and rheumatoid arthritis; and have potential utility in modulating the immune response to tissue transplantation. Methods of modulating autoimmunity with an agent that modulates cathepsin S activity, e.g., proteolysis of the Ii chain, as well as methods of treating a subject having an autoimmune disorder, methods of evaluating a treatment for its ability to modulate an immune response are described in WO 99/58153.

Compounds somewhat similar to those of the present invention are

described in the following references.

Winters, et. al. (Winters, G.; Sala, A.; Barone, D.; Baldoli, E. *J. Med. Chem.* **1985**, 28, 934-940; Singh, P.; Sharma, R. C. *Quant. Struct.-Act. Relat.* **1990**, 9, 29-32; Winters, G.; Sala, A.; Barone, D. in US-4500525 (1985)) have
5 described bicyclic pyrazoles of the type shown below. R never contains a heterocyclic ring and no protease inhibitor activity is ascribed to these molecules; they are described as α 1-adrenergic receptor modulators.

10

Shutske, et. al. claim the bicyclic pyrazoles below. The pyridine ring is aromatic in their system (Shutske, G. M.; Kapples, K. J.; Tomer, J. D. US-
15 5264576 (1993)). Although reference is made to R being a linker to a heterocycle, the claims specify only R = hydrogen. The compounds are referred to as serotonin reuptake inhibitors.

20

The compound 2-[4-[4-(3-methyl-5-phenyl-1H-pyrazol-1-yl)butyl]-1-piperazinyl]-pyrimidine is known from EP-382637, which describes pyrimidines having anxiolytic properties. This compound and analogs are further described
25 in EP-502786 as cardiovascular and central nervous system agents.

Pharmaceutical formulations with such compounds are disclosed in EP-655248 for use in the treatment of gastric secretion and as anti-ulcer agents. WO-

9721439 describes medicaments with such compounds for treating obsessive-compulsive disorders, sleep apnea, sexual dysfunctions, emesis and motion sickness.

5 The compounds 5-methyl-3-phenyl-1-[4-(4-phenyl-1-piperazinyl)butyl]-1H-indazole and 5-bromo-3-(2-chlorophenyl)-1-[4-(4-phenyl-1-piperazinyl)butyl]-1H-indazole, in particular the hydrochloride salts thereof, are known from WO-9853940 and CA 122:314528, where these and similar
10 possessing affinity for benzodiazepine receptors in the latter reference.

Detailed Description of the Invention

A target of the present invention was to determine whether the presentation of particular antigens in a human system is affected by the inhibition of cathepsin S. According to the invention, it now has been found
5 that inhibitors of cathepsin S block the presentation of several crude allergen extracts in a human *ex vivo* assay, thereby supporting the use of cathepsin S inhibitors for the treatment of such allergic conditions.

10 Blocking li degradation should decrease antigen presentation to CD4 T cells and disrupt the normal immune response. A cathepsin S inhibitor should specifically affect the activation of CD4 T cells, thus limiting the extent of concomitant immunosuppression, an undesirable side effect of corticosteroid therapy.

15 By using cathepsin S inhibitors according to the methods of the present invention, the immunological component of the allergic reaction can be blocked to varying degrees, with the advantage over current therapies of being more selective, having fewer or reduced side effects, or both. The present invention
20 is based, in part, on the finding that cathepsin S inhibitors can block the presentation of crude allergen extracts in a human *ex vivo* assay. This *ex vivo* system closely mimics the process that occurs in the whole body wherein antigens enter the blood stream, and are presented by antigen presenting cells, which in turn activate CD4 T cells. In the case of treating a subject, the
25 inhibitor or a metabolite thereof would also be present in the blood as in the *ex vivo* assay.

The invention features the treatment of an allergic condition using one or more pyrazole compounds of formula (I).

15 "Therapeutically effective amount" or "effective amount" means that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease or disorder being treated.

20 Concerning the various radicals in this disclosure and in the claims, three general remarks are made. The first remark concerns valency. As with all hydrocarbon radicals, whether saturated, unsaturated or aromatic, and whether or not cyclic, straight chain, or branched, and also similarly with all heterocyclic radicals, each radical includes substituted radicals of that type and monovalent, bivalent, and multivalent radicals as indicated by the context of
25 the claims. The context will indicate that the substituent is an alkylene or hydrocarbon radical with at least two hydrogen atoms removed (bivalent) or more hydrogen atoms removed (multivalent). An example of a bivalent radical linking two parts of the molecule is G in formula (I) which links two rings.

30 Second, radicals or structure fragments as defined herein are understood to include substituted radicals or structure fragments. Hydrocarbyls include monovalent radicals containing carbon and hydrogen such as alkyl, alkenyl, alkynyl, cycloalkyl, and cycloalkenyl (whether aromatic or unsaturated), as well as corresponding divalent radicals such as alkylene, alkenylene,

5

Using "alkyl" as an example, "alkyl" should be understood to include substituted alkyl having one or more substitutions, such as between 1 and 5, 1 and 3, or 2 and 4 substituents. The substituents may be the same (dihydroxy, dimethyl), similar (chlorofluoro), or different (chlorobenzyl- or aminomethyl-substituted). Examples of substituted alkyl include haloalkyl (such as fluoromethyl, chloromethyl, difluoromethyl, perchloromethyl, 2-bromoethyl, perfluoromethyl, and 3-iodocyclopentyl), hydroxyalkyl (such as hydroxymethyl, hydroxyethyl, 2-hydroxypropyl, aminoalkyl (such as aminomethyl, 2-aminoethyl, 3-aminopropyl, and 2-aminopropyl), nitroalkyl, alkylalkyl, and so on. A di(C₁₋₆ alkyl)amino group includes independently selected alkyl groups, to form, for example, methylpropylamino and isopropylmethylamino, in addition dialkylamino groups having two of the same alkyl group such as dimethyl amino or diethylamino.

10
15

20

Third, only stable compounds are intended. For example, where there is an NR'R" group, and R can be an alkenyl group, the double bond is at least one carbon removed from the nitrogen to avoid enamine formation. Similarly, where a dashed line is an optional sp² bond, if it is absent, the appropriate hydrogen atom(s) is(are) included.

25

Preferred substitutions for Ar or Ar₁ include methyl, methoxy, fluoromethyl, difluoromethyl, perfluoromethyl (trifluoromethyl), 1-fluoroethyl, 2-fluoroethyl, ethoxy, fluoro, chloro, and bromo, and particularly methyl, bromo, chloro, perfluoromethyl, perfluoromethoxy, methoxy, and fluoro. Preferred substitution patterns for Ar or Ar₁ are 4-substituted or 3,4-disubstituted phenyl.

D. Formulation and Administration

The present compounds inhibit the proteolytic activity of human
5 cathepsin S and therefore are useful as a medicine especially in methods for
treating patients suffering from allergic disorders or conditions which are
modulated or regulated by the inhibition of cathepsin S activity.

The invention features a method for treating a subject with an allergic
10 condition mediated by cathepsin S, said method comprising administering to
the subject a therapeutically effective amount of a pharmaceutical composition
comprising a compound of the invention. The invention also provides a
method for inhibiting cathepsin S activity in a subject, wherein the method
comprises administering to the subject a therapeutically effective amount of a
15 pharmaceutical composition comprising a compound of the invention.

In view of their inhibitory effect on the proteolytic activity of human
cathepsin S the compounds of the present invention may be formulated into
various pharmaceutical forms for administration purposes. To prepare these
20 pharmaceutical compositions, an effective amount of a particular compound, in
base or acid addition salt form, as the active ingredient is intimately mixed with
a pharmaceutically acceptable carrier.

A carrier may take a wide variety of forms depending on the form of
25 preparation desired for administration. These pharmaceutical compositions are
desirably in unitary dosage form suitable, preferably, for oral administration or
parenteral injection. For example, in preparing the compositions in oral dosage
form, any of the usual pharmaceutical media may be employed. These include
water, glycols, oils, alcohols and the like in the case of oral liquid preparations
30 such as suspensions, syrups, elixirs and solutions; or solid carriers such as
starches, sugars, kaolin, lubricants, binders, disintegrating agents and the like
in the case of powders, pills, capsules and tablets. In view of their ease in
administration, tablets and capsules represent the most advantageous oral

dosage unit form, in which case solid pharmaceutical carriers are generally employed. For parenteral compositions, the carrier will usually comprise sterile water, at least in large part, though other ingredients, for example, to aid solubility, may be included. Injectable solutions, for example, may be prepared in which the carrier comprises saline solution, glucose solution or a mixture of saline and glucose solution. Injectable suspensions may also be prepared in which case appropriate liquid carriers, suspending agents and the like may be employed. In the compositions suitable for percutaneous administration, the carrier optionally comprises a penetration enhancing agent and/or a suitable wetting agent, optionally combined with suitable additives of any nature in minor proportions, which additives do not cause a significant deleterious effect to the skin. Such additives may facilitate the administration to the skin and/or may be helpful for preparing the desired compositions. These compositions may be administered in various ways, e.g., as a transdermal patch, as a spot-on, as an ointment. Acid addition salts of the compounds of formula I, due to their increased water solubility over the corresponding base form, are more suitable in the preparation of aqueous compositions.

It is especially advantageous to formulate the aforementioned pharmaceutical compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used in the specification herein refers to physically discrete units suitable as unitary dosages, each unit containing a predetermined quantity of active ingredient calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. Examples of such dosage unit forms are tablets (including scored or coated tablets), capsules, pills, powder packets, wafers, injectable solutions or suspensions, teaspoonfuls, tablespoonfuls and the like, and segregated multiples thereof.

Pharmaceutically acceptable acid addition salts include the therapeutically active non-toxic acid addition salt forms which the disclosed compounds are able to form. The latter can conveniently be obtained by treating the base form with an appropriate acid. Appropriate acids comprise, for example,

inorganic acids such as hydrohalic acids, e.g. hydrochloric or hydrobromic acid; sulfuric; nitric; phosphoric and the like acids; or organic acids such as, for example, acetic, propanoic, hydroxyacetic, lactic, pyruvic, oxalic, malonic, succinic, maleic, fumaric, malic, tartaric, citric, methanesulfonic, ethanesulfonic, benzenesulfonic, *p*-toluenesulfonic, cyclamic, salicylic, *p*-aminosalicylic, palmoic and the like acids. The term addition salt also comprises the solvates which the disclosed compounds, as well as the salts thereof, are able to form. Such solvates are for example hydrates, alcoholates and the like. Conversely the salt form can be converted by treatment with alkali into the free base form.

Stereoisomeric form defines all the possible isomeric forms which the compounds of formula (I) may possess. Unless otherwise mentioned or indicated, the chemical designation of compounds denotes the mixture of all possible stereochemically isomeric forms, said mixtures containing all diastereomers and enantiomers of the basic molecular structure. More in particular, stereogenic centers may have the (R)- or (S)-configuration; substituents on bivalent cyclic saturated radicals may have either the cis- or trans-configuration. The invention encompasses stereochemically isomeric forms including diastereoisomers, as well as mixtures thereof in any proportion of the disclosed compounds. The disclosed compounds may also exist in their tautomeric forms. Such forms although not explicitly indicated in the above and following formulae are intended to be included within the scope of the present invention.

Those of skill in the treatment of allergic disorders or conditions mediated by the cathepsin S enzyme could easily determine the effective daily amount from the test results presented hereinafter and other information. In general it is contemplated that a therapeutically effective dose would be from 0.001 mg/kg to 5 mg/kg body weight, more preferably from 0.01 mg/kg to 0.5 mg/kg body weight. It may be appropriate to administer the therapeutically effective dose as two, three, four or more sub-doses at appropriate intervals throughout the day. Said sub-doses may be formulated as unit dosage forms,

for example, containing 0.05 mg to 250 mg, and in particular 0.5 to 50 mg of active ingredient per unit dosage form. Examples include 2 mg, 4 mg, 7 mg, 10 mg, 15 mg, 25 mg, and 35 mg dosage forms. Compounds of the invention may also be prepared in time-release or subcutaneous or transdermal patch formulations. Disclosed compound may also be formulated as a spray or other topical or inhalable formulations.

The exact dosage and frequency of administration depends on the particular compound of formula (I) used, the particular condition being treated, the severity of the condition being treated, the age, weight and general physical condition of the particular patient as well as other medication the patient may be taking, as is well known to those skilled in the art. Furthermore, it is evident that said effective daily amount may be lowered or increased depending on the response of the treated patient and/or depending on the evaluation of the physician prescribing the compounds of the instant invention. The effective daily amount ranges mentioned herein are therefore only guidelines.

The next section includes detailed information relating to the preparation, characterization, and use of the disclosed compounds.

A. 4-(6-Chloro-3-nitro-pyridin-2-ylamino)-piperidine-1-carboxylic acid tert-butyl ester.

A stirring solution of 20 g (0.10 mol) of 2,6-dichloro-3-nitro-pyridine in DMF (245 mL) was cooled to 0 °C. After 5 min, 9.87 g (0.05 mol) of 4-amino-piperidine-1-carboxylic acid tert-butyl ester and 6.8 g (0.05 mol) of K₂CO₃ were added, resulting in a suspension. The organic layer was dried over anhydrous Na₂SO₄, and concentrated to give a brown oil. The product was purified using silica gel chromatography (silica, 100%CH₂Cl₂, then 10% EtOAc/hexanes) to afford 8.99 g (51%) of the desired product as a bright yellow solid. The washes were combined and extracted with EtOAc (100 mL). The combined organic layers were dried over Na₂SO₄ and concentrated to afford 6.1 g (99%) of the desired product as a bright yellow solid. MS (electrospray): exact mass calculated for C₁₇H₂₇N₅O₄, 365.21; *m/z* found, 388.19 [M+Na]⁺. ¹H NMR (400 MHz, CDCl₃): 8.74 (d, *J* = 7.07 Hz, 1H), 8.18 (d, *J* = 9.4 Hz, 1H), 5.97 (d, *J* = 7.3 Hz, 1H), 4.28-4.16 (m, 1H), 4.07-3.93 (m, 2H), 3.17 (s, 6H), 3.01 (t, *J* = 11.9 Hz, 2H), 2.05 (dd, *J* = 12.4 Hz and 3.03 Hz, 2H), 1.60-1.50 (m, 2H), 1.47 (s, 9H).

C. 4-(5-Dimethylamino-1-methyl-2-oxo-1,2-dihydro-imidazo[4,5-b]pyridin-3-yl)-piperidine-1-carboxylic acid tert-butyl ester.

A stirring solution of 5.3 g (0.014 mol) of 4-(6-dimethylamino-3-nitro-pyridin-2-ylamino)-piperidine-1-carboxylic acid tert-butyl ester in methanol/EtOAc (73 mL/15 mL) was degassed. 10% Pd/C (1.17 g, 0.5 mmol) was added as a suspension in EtOH (5 mL), followed by ammonium formate (4.5 g, 0.073 mol). The mixture was stirred at room temperature for 3 h. The reaction mixture was then filtered through celite and the filtrate was concentrated, giving a purple oil. The residue was then dissolved in THF (73 mL), and 11.7 g (0.073 mol) of CDI was added, and the reaction was heated to 98 °C and stirred for 16 h. The mixture was then cooled and concentrated. The crude product was then partitioned between EtOAc (800 mL) and NaHCO₃ (100 mL), and the organic layer was washed with water (5 x 100 mL) and NaCl (100 mL). The combined aqueous layers were back-extracted with EtOAc (150 mL). The resulting organic layers were combined and dried over Na₂SO₄ and concentrated. The residue (2.4 g) was dissolved in THF (73 mL). To this stirring solution was added KHMDS (3.46 g, 0.017 mol) and iodomethane (10.3 g, 0.072 mol), and the mixture was allowed to stir for 20 min. The solvent was then concentrated, and the crude product was partitioned between EtOAc (600 mL) and NaHCO₃ (200 mL). The organic layer was washed with NaHCO₃ (150 mL), dried over Na₂SO₄, and concentrated. Purification using flash chromatography (silica, 80% EtOAc/hexanes) afforded 2.4 g (67% yield, 3 steps, based upon using 2/3 material at methylation stage) of desired product as a white solid. MS (electrospray): exact mass calculated for C₁₉H₂₉N₅O₃, 375.23; *m/z* found, 276.17 [M+H-100]⁺. ¹H NMR: (400MHz, CDCl₃): 7.02 (d, *J* = 8.6 Hz, 1H), 6.15 (d, *J* = 8.6 Hz, 1H), 4.46 (tt, *J* = 12.0 Hz and 4.0 Hz, 1H), 4.38-4.11(m, 2H), 3.33 (s, 3H), 3.01 (s, 6H), 2.95-2.73 (m, 2H), 2.73-2.55 (m, 2H), 1.77-1.61 (m, 2H), 1.47 (s, 9H).

Cathepsin S Inhibition Assay.

Recombinant human cathepsin S (CatS) was expressed in the
 baculovirus system and purified in one step with a thiopropyl-sepharose
 15 column. 10-L yielded ~700 mg of CatS and N-terminal sequencing confirmed
 identity. The assay is run in 100 mM sodium acetate pH 5.0 containing 1 mM
 DTT and 100 mM NaCl. The substrate for the assay is

(Aedens)EKARVLAEEA(Dabcyl)K-amide

20

The K_m for the substrate is around 5 μ M but the presence of substrate inhibition
 makes kinetic analysis difficult. With 20 μ M substrate the assay rate is linear
 over the range of 1-8 ng CatS in 100 μ l reaction. Using 2 ng/well of CatS, the
 production of product is linear and yields ~7-fold signal after 20 min with only
 25 20% loss of substrate. Primary assays are run by quenching the reaction after
 20 min with 0.1% SDS and then measuring the fluorescence. For other
 assays, measurements are taken every min for 20 min. The rate is calculated

from the slope of the increase and the percent inhibition is calculated from this
(See Tables 1 and 2 below).

Example 55

Ex vivo inhibition by cathepsin S inhibitors of the allergic response

The following assay demonstrates that cathepsin S inhibitors block the
5 response of human T cells to crude allergen extracts.

Materials and Methods.

Reagents. Glycerinated crude allergen extracts of house dust mites
10 (*Dermataphagoides pteronyssinus*, *Dermataphagoides farinae*) and ragweed
[*Ambrosia trifida* (giant), *Ambrosia artemisiifolia* (short)] were purchased from
Hollister-Stier Laboratories (Minneapolis, MN). Concanavalin A (ConA) was
purchased from Calbiochem (La Jolla, CA).

15 Donors. All allergic donors were prescreened for their specific allergies using
RAST tests. The HLA class II haplotypes of these donors were determined
using PCR.

Cell culture. Human peripheral blood mononuclear cells (PBMC) were purified
20 from blood of allergic donors using Ficoll-Hypaque gradient followed by washes
with phosphate buffered saline (PBS). PBMC were cultured in triplicate or
duplicate at $0.5\text{--}1.0 \times 10^6$ cells/well with titrated doses of allergen extracts, in
the presence or absence of a known cathepsin S inhibitor, LHVS
(morpholinurea-leucine-homo-phenylalanine-vinylsulfonephenyl) (Palmer et al.
25 (1995), J. Med. Chem. 38:3193 and Riese et al. (1996), Immunity 4:357).
Serial diluted stock solutions of LHVS were first made in 100% DMSO and then
diluted 1:15 in 40% Hydroxypropynyl cyclodextrin (HPCD). Three microliters of
LHVS in HPCD was added into PBMC cultures (200 μL /well). After 6 days of
culture, 1 μCi /well of ^3H -thymidine (TdR) was added. Eighteen hours later,
30 cells were harvested using a Filtermate Harvester (Packard) and counted for
 ^3H -TdR incorporation on Topcount (Packard).

Inhibition of T cell proliferative responses to house dust mites.

About 10% of most populations are allergic to house dust mites (HDM) of the genus *Dermatophagoides* with *Dermatophagoides pteronyssinus* (Der p) and *D. farinae* (Der f) being the two major species present in varying proportions in most countries. The major clinical manifestations are asthma and perennial rhinitis.

Effect of cathepsin S inhibition on activation of HDM allergen-specific CD4 T cells was tested in an *ex vivo* human T cell-proliferation assay. Culturing PBMC with crude extracts from either *Der p* or *Der f*, resulted in strong proliferation (Figure 1A). This proliferation consisted primarily of allergen-specific CD4 T cells. When cathepsin S activity was blocked by a specific cathepsin S inhibitor, LHVS (cf. Riese et al. (1996) Immunity 4:357) the proliferation was strongly inhibited (Figure 1B). Inhibition by LHVS was specific for responses induced by HDM extracts since T cell proliferative responses induced by ConA, a pan-T cell mitogen, were not affected. Furthermore, this inhibition was observed for all four HDM-allergic donors tested regardless of the different HLA class II haplotypes (DR4; DR7, 15; DR11, 15; and DR4, 11).

This system is very similar to an *in vivo* situation. The allergic subject would be exposed to a crude mixture of allergens that would lead to the proliferation of T cells and an allergic response. The observation of inhibition of CD4 T cell activation by a cathepsin S inhibitor shows that such inhibitors can be effective in treating a generalized population of patients allergic to house dust mites.

25

Inhibition of T cell proliferative responses to ragweed

About 10% of population in US are allergic to ragweed pollen, making it one of the most important allergens in terms of clinical diseases. Allergens from pollens are a common precipitant of rhinitis and asthma in this population.

30

The effect of cathepsin S inhibition on activation of ragweed allergen-specific CD4 T cells was tested in an *ex vivo* human T cell-proliferation assay.

Culturing PBMC with crude extracts from both short and giant ragweed resulted in strong proliferation (Figure 2A). This proliferation consisted mainly of allergen-specific CD4 T cells. When cathepsin S activity was blocked by a specific cathepsin S inhibitor, LHVS (cf. Riese et al. (1996) Immunity 4:357) the proliferation was strongly inhibited (Figure 2B). Inhibition by LHVS was specific for responses induced by ragweed since T cell proliferative responses induced by ConA, a pan-T cell mitogen, were not affected. Furthermore, this inhibition was observed for the two ragweed-allergic donors tested regardless of the different HLA class II haplotypes (DR7, 15 and DR4, 11).

Similar experiments were run using three additional CatS inhibitors, compounds from Examples 8, 52, and 53 above, with the results shown in FIGS. 3A, 3B, 4A, and 4B.

This system is very similar to an *in vivo* situation. The allergic subject would be exposed to a crude mixture of allergens that would lead to the proliferation of T cells and an allergic response. The observation of inhibition of CD4 T cell activation by a cathepsin S inhibitor shows that such inhibitors can be effective in treating a generalized population of patients allergic to ragweed.

Example 56

Monitoring cathepsin S inhibition in human blood.

The effect of *in vivo* administration of cathepsin S inhibitors, in a clinical trial setting, can be monitored by measuring accumulation of an intermediate degradation product of invariant chain (Ii), i.e. the p10Ii fragment, in blood of dosed subjects. After administration of a cathepsin inhibitor for a certain period of time, for example, between 0.01 and 50 mg/kg/day, to result in a blood concentration of between 1 nM–10 μ M, for 16–30 h, blood is drawn and white blood cells are purified, e.g. either by lysis of red blood cells or by a Ficoll-

Hypaque gradient centrifugation. Whole cell lysates of WBC are then made and analyzed by either a Western blot assay or an ELISA assay. For the Western blot assay, cell lysates are first resolved on SDS-PAGE gels. After transferring to nitrocellulose membranes, li and its intermediate degradation products, including the p10li, can be detected using a mouse mAb against li, e.g. Pin1.1, or rabbit polyclonal antibodies specific for the C-terminus of the p10li fragment or against the entire p10li fragment. For ELISA assay, a pair of antibodies against li, including Pin1.1, and a rabbit polyclonal antibody or a mouse monoclonal antibody specific for p10li, can be used. The same assay can also be applied to monitor the effect of cathepsin S inhibitors *in vivo* in animal studies, for example in monkeys, dogs, pigs, rabbits, guinea pigs, and rodents.

In the present example PBMC from human blood were incubated with the cathepsin S inhibitor, LHVS (morpholinurea-leucine-homo-phenylalanine-vinylsulfonephenyl, also referred to as 4-morpholinecarboxamide, N-[(1S)-3-methyl-1-[[[(1S,2E)-1-(2-phenylethyl)-3-(phenylsulfonyl)-2-propenyl]amino]carbonyl]butyl]-. This compound has been described in US Patent No. 5,976,858 and in Palmer et al. (1995) J. Med. Chem. 38:3193 and Riese et al. (1996) Immunity 4:357. After incubation for 24 h the samples were run using standard SDS-PAGE protocols, transferred to nitrocellulose membranes and probed with an antibody that recognizes the invariant chain including the p10li fragment. In the presence of LHVS the p10li fragment was seen, representing a block in the degradation of li due to inhibition of cathepsin S.

Example 57

Monitoring *in vivo* inhibition of allergenic response by cathepsin S inhibitors.

To demonstrate the efficacy of cathepsin S inhibitors for suppressing allergic responses *in vivo*, allergic volunteers are dosed with cathepsin S inhibitors to levels where invariant chain degradation is inhibited. Allergens are

deposited subcutaneously, and the size of the cutaneous reactions are determined at 15 min, 6 h and 24 h. Skin biopsies are performed at 24 h. The immediate weal and flare response is not mediated by a T cell response and is not expected to be influenced by cathepsin S inhibitors, while the late phase
5 induration (noticeable at 6 hours, more pronounced at 24 hours) is characterized by activation and infiltration of CD4 T cells (as well as of eosinophils) and should be inhibited by administration of inhibitors of cathepsin S. The skin biopsies are used to determine the cellular composition in the induration, and cathepsin S treated subjects are expected to have fewer
10 activated CD4 T cells present than placebo-treated subjects.

References for these procedures are provided in Eberlein-Konig et al. (1999) Clin. Exp. Allergy 29:1641-1647 and in Gaga et al. (1991) J. Immunol. 147:816-822.

15

As controls for the experiment, prednisone and cyclosporine A will be used. Prednisone will inhibit both the immediate and the late phase responses, while cyclosporin A will inhibit only the late phase response.
